*Priory assumptions choking science
Doctrines devoid of truth
Blocking civilization*

Priory assumptions choking science - Doctrines devoid of truth blocking civilization .

None of the other greenhouse gases, apart from CO_2 , which human living has increased, such as nitrous oxide that is said to be a "powerful greenhouse gas," have any significant effect on the climate processes that are totally controlled by astrophysical conditions.

The N₂O molecule, for example, is dragged into the arena of the global warming scare stories, because its heat absorption efficiency is many times larger than that of CO₂, because of its weak atomic bonding, while it is rarely ever mentioned that nitrous oxide is a thousand times less dense in the atmosphere than CO₂, which affects nothing either. However, its dramatically higher absorption coefficient, for which it is called a powerful greenhouse gas, makes it an easy subject to pin global warming scare stories on.

**When the truth hinders profiteering,
it is inconvenient and is silenced**

**Devoid of truth
the Global Warming Doctrine
becomes a prison without fences**

Freedom ends

Al Gore's speech on Global Warming at the University of Miami BankUnited Center, Feb 28th, 2007

The problem with the so-called modern climate science is, that it is 'hired' to prove a priory assumption, the assumption that human living is destroying the climate balance. While this is far from being the case, the prevailing climate science is hired to hide the actual physical facts and support instead the tune of a fairy tale that is politically desired for numerous objectives, such as for profit, and to maintain imperial dominance, and also to enable depopulation and so on.

Ptolemy's Epicycles Planetary System

The planets are assumed to move in a small circle called an epicycle, which in turn moves along a larger circle called a deferent that is centered half-way between the Earth and imaginary point called the equant.

Today's dominance of doctrines overshadowing science poses the same type of tragedy that science has suffered throughout the ages, as far back as Ptolemy, the astronomer who became famous for his use of epicycles to conform with doctrines that were false and could only be supported with magical concepts, like the doctrines of orbiting stars in circular paths, as today the Big Bang Universe, and manmade climate change. The doctrine that had choked astronomy for almost two millennia demanded that orbits must follow the path of perfect circles. We sing similar tunes today on many fronts of science.

Theoretical solar-fusion

The science-epicycles

- The heat-energy for the fusion process to overcome the Coulomb barrier is deemed to be caused by the power of gravity - the weakest force in the universe, overcoming one of the strongest forces.
- The energy that is deemed to be released is said to be derived from the conversion of protons into neutrons and their mutual interaction.
- The energy density by volume is deemed to be equal to the body-heat energy production of a human being at rest, which is deemed sufficient to power the Sun, because of its immense volume.

One of these tunes is the Nuclear Fusion Power doctrine. A nuclear fusion-powered sun is impossible since no real physical principles exist to support the theory. Nuclear fusion is an energy consuming process, not an energy creating process. Large amounts of energy are required to bind an electron to a proton to create an atom, or to bind protons to each other by overpowering the electric repulsive force, one of the strong forces of the universe. All this is deemed to be caused the action of the weakest of the universal forces, the force of gravity.

In a nuclear-fusion bomb explosion no energy is created. The bomb's energy is latent energy that was previously invested into two types of over-built hydrogen atoms. The overbuilt isotopes fission off a part of their structure, that becomes unbound and releases the latent energy that had been previously invested in the process of binding a proton to an overbuilt nucleus. No energy is created in this process. Nuclear fusion power is a contradiction, a nice dream, but it remains an epicycle that doesn't stand up in the real world.

Logical deductions proceeding from a priory platform invariably lead humanity into a trap that blocks the processes of real discoveries, which are the processes of real science that take us beyond priory assumptions. Today, the climate sciences are trapped by the same defective logic that Astronomy had been trapped in for nearly two millennia, from Ptolemy all the way to Kepler, who broke out of this trap, and who thereby raised the platform of science from its grounding in doctrine to its discovery of the truth.

A common electric principle is evident on the Earth and the Sun

By remaining trapped into epicycles, humanity denies itself the discovery of the anti-entropic energy system that powers the Sun electrically, and thereby denies itself its potential utilization of the near-infinite cosmic electric power system to power its rather modest needs. It also denies itself its potential awakening to the already unfolding Ice Age transition dynamics, that would inspire the relocation of the endangered agriculture while there is still time left to do so. And it also denies itself the chance to break out of the manmade global warming doctrine by which it has become mentally incarcerated,

The doctrine that CO₂ is a climate villain, was imposed in 1974 at the U.N. world population conference in Bucharest. The conference was focused on overpopulation, and the cure, depopulation. On this wider scene the CO₂ doctrine emerged as one of the latest political doctrines that play a destructive role in the long war of empire against humanity in which empire struggles to secure its dominance and its very existence that is always threatened by human development.

Primitive living is a
mythological concept

The reality is far from being ideal
or even tolerable, and is deadly
with the Ice Age on the horizon

Depopulation is a policy of the masters of empire. It has been that for a long time. The CO2 doctrine is deployed on this front as one of the weapons that were wielded by the masters of empire for their long-term objective. Their often repeated goal has become to reduce the number of people living on our planet from the present world population of 7 billion people, down towards a minuscule, impotent, and impoverished society of less than one billion.

One billion in chronic hunger

"What did he do?"

"Why are we here?"

How many die in silence?
100 million a year?

Would you like to join the ranks of the depopulated? You may not have a choice from a certain point on. The CO_2 doctrine that society protects is used for genocidal projects to eliminate six billion people by burning their food. Your name may already be on the list of those to be eliminated.

Once CO2 is defined as a villain, and is accepted so by society, then whatever produces CO2, such as the industries that support human living, and transportation, etc., even humanity itself, can thereby be demanded to be torn down.

Food NOT
for eating

For this purpose the biofuels have been invented under the clean-air flag, as a renewable fuel. In real terms they double the CO2 emissions while they consume vast amounts of food for their production, in a system that produces almost no energy advantage in the end when all the input energy is counted. The only effect that biofuels are producing efficiently, is large-scale genocide by starvation.

Mongolian woman condemned to die of starvation - 1913

**Biofuels
have the
same effect**

There was a time in some cultures that death by starvation was enforced as a form of capital punishment. Now 1 billion people are treated to this fate, though only a few hundred million die of it every year.

At the current U.S. production level of 13.8 billion gallons of ethanol per year, which is essentially corn liquor, the amount of feedstock in corn that is required every year for the production of it would all by itself provide 1,200 calories of nourishment for 1 billion people for an entire year. Many of the victims are simply left to die.

Compare

Extremely high energy density

Near-zero energy density

If the worldwide production of ethanol is considered, the amount of food being burnt is roughly double. In a world in which a billion people are living in chronic starvation, shutting down the biofuels madness would go a long way towards building a human world without hunger. But this goal is being blocked. The food burning is protected, and the mythical manmade global warming doctrine is one of the reasons cited for it. And in the shadow of it all, real energy production is also being prevented.

CANADA

If one adds up all the food resources that are being burned worldwide, a manmade tragedy comes to light of unimaginable proportions that probably claims conservatively 100 to 200 million victims every year, or 3 to 6 people every second, of every hour, of every day and night. The imposed silent death toll on this scale is the equivalent of starving 3 to 6 times the entire population of Canada out of existence, every year, in far off places spread around the world.

The selection process at Birkenau
that few had witnessed or knew about

The Nazi
depopulation
holocaust
killed 6 million
people in 6 years

The biofuels were originally invented under the CO₂ doctrine, to reduce carbon emission and thereby to reduce global warming, while in reality the carbon emissions are doubled by the biofuels energy cycle. Nor can the biofuels be called an energy resource, as they are claimed to be, because they require nearly as much energy input for the production process than they give back as a fuel. As I said, they are only efficient for producing genocide, and they do this on a scale that pales the Nazi holocaust into insignificance.

Civilization requires that new energy resources with increased energy-flux density are developed before applied resources diminish

Some people claim that biofuels have been invented as an alternate energy resource under the peak-oil scare on the basis of the doctrine that the world is running out of energy resources. But this too is just a doctrine. The doctrine is the intended to prevent real energy development.

The world should be way past the stage of using oil as an energy resource, and much less so food. The world should be powered by nuclear energy and hydrogen fuels. Burning oil is as archaic as burning wood. Both resources are inadequate, and so they do become. But before they do so, new resources should have taken their place. We can still do this. The USA has all by itself 900,000 gigawatt-years of thorium fuel sitting unused on the ground. And even this too, the cleanest, safest, and most efficient nuclear energy option, should have been already superseded by us tapping into the cosmic electric energy grid.

Peak oil means that real meaningful energy development has been prevented and is not being allowed. An energy-starved world is good for profit, and a society living in poverty is more easily controlled. That's how peak oil ties into the reality scene. CO2 and biofuels have nothing to do with that.

It is more likely the case that the peak-oil scare was invented to justify the biofuels genocide to fulfill the depopulation doctrine, and that the CO2 doctrine was invented for the snake-oil salesmen to sell the sacrifices. With the ongoing Ice Age transition dynamics now causing evermore drought and other climate disasters, you will soon find yourself being sacrificed too, when food becomes increasingly less-available for eating, even to you, or is driven up in price so that it becomes way beyond your means to pay for it. Then my friend, you too will be depopulated, even while you hail the name of CO2 with your last breath and commit yourself to reducing the human CO2 emissions.
